## APPLICATION NOTES

### Auto Restart Protection

When the fan motor is locked by an external force, the device will temporarily turn off electrical power to the motor and restart automatically when the locked rotor condition is released.

### Tachometer Signal (Yellow Wire)

The tachometer signal is for detecting the rotational speed of the fan motor. The output will be a square wave when fan is operating and  $V_{FG}$  or  $V_{CE}$  depending on the locked rotor position when fan motor is locked (See Figures 1~2 below).

Figure 1: Tachometer Output Circuit

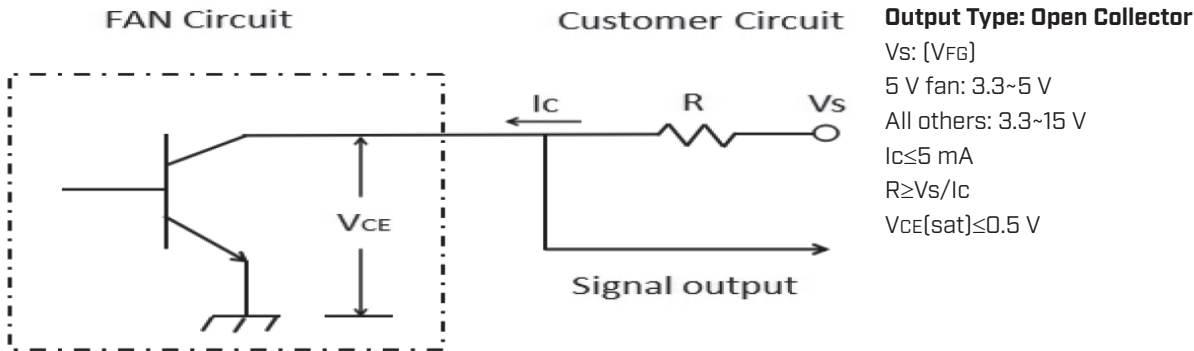

Figure 2: Tachometer Output Waveform

### PWM Signal (Blue Wire)

This wire is for speed control of the fan motor using a PWM input signal from the customer circuit (See Figure 3 below).

Figure 3: PWM Input Signal

PWM Duty Cycle (%) =  $T1 / T \times 100\%$   
 PWM Frequency Range: 20~30 kHz  
 PWM  $V_{IH}$  = 2.8~5.5 V  
 PWM  $V_{IL}$  = 0~0.6 V
