8-Pin, 24-Bit, 96 kHz Stereo D/A Converter

Features

- Complete Stereo DAC System: Interpolation, D/A, Output Analog Filtering
- 24-Bit Conversion
- 96 dB Dynamic Range
- -88 dB THD+N
- Low Clock-Jitter Sensitivity
- Single +5 V Power Supply
- Filtered Line-Level Outputs
- On-Chip Digital De-emphasis
- Popguard® Technology
- Functionally Compatible with CS4330/31/33

Description

The CS4334 family members are complete, stereo digital-to-analog output systems including interpolation, 1-bit D/A conversion and output analog filtering in an 8-pin package. The CS4334/5/8/9 support all major audio data interface formats, and the individual devices differ only in the supported interface format.

The CS4334 family is based on Delta-Sigma modulation, where the modulator output controls the reference voltage input to an ultra-linear analog low-pass filter. This architecture allows for infinite adjustment of sample rate between 2 kHz and 100 kHz simply by changing the master clock frequency.

The CS4334 family contains on-chip digital de-emphasis, operates from a single +5V power supply, and requires minimal support circuitry. These features are ideal for set-top boxes, DVD players, SVCD players, and A/V receivers.

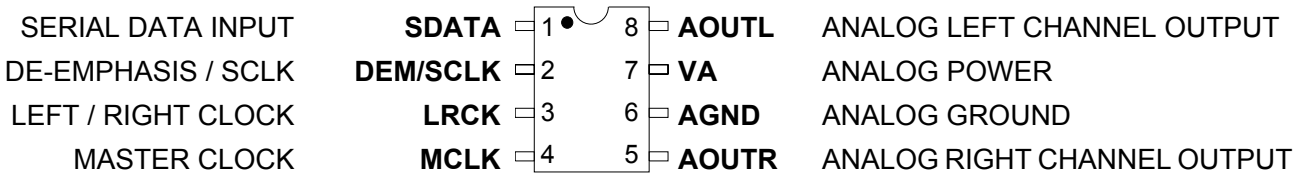
PIN DESCRIPTIONS



No.	Pin Name	I/O	Pin Function and Description
1	SDATA	I	**Serial Audio Data Input** - Two's complement MSB-first serial data is input on this pin. The data is clocked into the CS4334/5/8/9 via internal or external SCLK, and the channel is determined by LRCK.
2	DEM/SCLK	I	**De-Emphasis/External Serial Clock Input** - Used for de-emphasis filter control or external serial clock input.
3	LRCK	I	**Left/Right Clock** - Determines which channel is currently being input on the Audio Serial Data Input pin, SDATA.
4	MCLK	I	**Master Clock** - Frequency must be 256x, 384x, or 512x the input sample rate in BRM and either 128x or 192x the input sample rate in HRM.
5	AOUTR	O	**Analog Right Channel Output** - Typically 3.5 Vp-p for a full-scale input signal.
6	AGND	I	***Analog Ground*** - Analog ground reference is 0V.
7	VA	I	**Analog Power** - Analog power supply is nominally +5 V.
8	AOUTL	O	**Analog Left Channel Output** - Typically 3.5 Vp-p for a full-scale input signal.

2. CHARACTERISTICS AND SPECIFICATIONS

(All Min/Max characteristics and specifications are guaranteed over the Specified Operating Conditions. Typical performance characteristics and specifications are derived from measurements taken at nominal supply voltages and T_A = 25°C.)

SPECIFIED OPERATING CONDITIONS

(AGND = 0V; all voltages with respect to ground.)

Parameters		Symbol	Min	Nom	Max	Units
DC Power Supply		VA	4.75	5.0	5.5	V
Ambient Operating Temperature (Power Applied)	-KSZ, -KSZR	T_A	-10	-	+70	°C
	-DSZ, -DSZR		-40	-	+85	°C

ABSOLUTE MAXIMUM RATINGS

(AGND = 0V; all voltages with respect to ground.)

Parameters	Symbol	Min	Max	Units
DC Power Supply	VA	-0.3	6.0	V
Input Current, Any Pin Except Supplies	I_{in}	-	±10	mA
Digital Input Voltage	V_{IND}	-0.3	VA+0.4	V
Ambient Operating Temperature (power applied)	T_A	-55	125	°C
Storage Temperature	T_{stg}	-65	150	°C

WARNING: Operation at or beyond these limits may result in permanent damage to the device. Normal operation is not guaranteed at these extremes.

ANALOG CHARACTERISTICS

(Full-Scale Output Sine Wave, 997 Hz; Test load R_L = 10 kΩ, C_L = 10 pF (see Figure 2). Fs for Base-Rate Mode = 48 kHz, Measurement Bandwidth 10 Hz to 20 kHz, unless otherwise specified; Fs for High-Rate Mode = 96 kHz, Measurement Bandwidth 10 Hz to 40 kHz, unless otherwise specified.)

N equals MCLK divided by SCLK

3. GENERAL DESCRIPTION

The CS4334 family of devices offers a complete stereo digital-to-analog system including digital interpolation, fourth-order delta-sigma digital-to-analog conversion, digital de-emphasis and analog filtering, as shown in Figure 8. This architecture provides a high tolerance to clock jitter.

The primary purpose of using delta-sigma modulation techniques is to avoid the limitations of resistive laser trimmed digital-to-analog converter architectures by using an inherently linear 1-bit digital-to-analog converter. The advantages of a 1-bit digital-to-analog converter include: ideal differential linearity, no distortion mechanisms due to resistor matching errors and no linearity drift over time and temperature due to variations in resistor values.

The CS4334 family of devices supports two modes of operation. The devices operate in Base Rate Mode (BRM) when MCLK/LRCK is 256, 384 or 512 and in High Rate Mode (HRM) when MCLK/LRCK is 128 or 192. High Rate Mode allows input sample rates up to 100 kHz.

3.1 Digital Interpolation Filter

The digital interpolation filter increases the sample rate, Fs, by a factor of 4 and is followed by a 32× digital sample-and-hold (16× in HRM). This filter eliminates images of the baseband audio signal which exist at multiples of the input sample rate. The resulting frequency spectrum has images of the input signal at multiples of 4 Fs. These images are easily removed by the on-chip analog low-pass filter and a simple external analog filter (see Figure 1).

3.2 Delta-Sigma Modulator

The interpolation filter is followed by a fourth order delta-sigma modulator which converts the interpolation filter output into 1-bit data at a rate of 128 Fs in BRM (or 64 Fs in HRM).

3.3 Switched-Capacitor DAC

The delta-sigma modulator is followed by a digital-to-analog converter which translates the 1-bit data into a series of charge packets. The magnitude of the charge in each packet is determined by sampling of a voltage reference onto a switched capacitor, where the polarity of each packet is controlled by the 1-bit data. This technique greatly reduces the sensitivity to clock jitter and provides low-pass filtering of the output.

3.4 Analog Low-Pass Filter

The final signal stage consists of a continuous-time low-pass filter which serves to smooth the output and attenuate out-of-band noise.

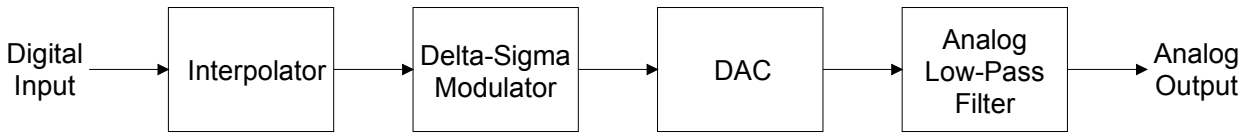

Figure 8. System Block Diagram

4. SYSTEM DESIGN

The CS4334 family accepts data at standard audio sample rates including 48, 44.1 and 32 kHz in BRM and 96, 88.2 and 64 kHz in HRM. Audio data is input via the serial data input pin (SDATA). The Left/Right Clock (LRCK) defines the channel and delineation of data, and the Serial Clock (SCLK) clocks audio data into the input data buffer. The CS4334/5/8/9 differ in serial data formats as shown in Figures 10-13.

4.1 Master Clock

MCLK must be either 256x, 384x or 512x the desired input sample rate in BRM and either 128x or 192x the desired input sample rate in HRM. The LRCK frequency is equal to Fs, the frequency at which words for each channel are input to the device. The MCLK-to-LRCK frequency ratio is detected automatically during the initialization sequence by counting the number of MCLK transitions during a single LRCK period. Internal dividers are set to generate the proper clocks. Table 1 illustrates several standard audio sample rates and the required MCLK and LRCK frequencies. Please note there is no required phase relationship, but MCLK, LRCK and SCLK must be synchronous.

LRCK (kHz)	MCLK (MHz)				
	HRM		BRM		
	128x	192x	256x	384x	512x
32	4.0960	6.1440	8.1920	12.2880	16.3840
44.1	5.6448	8.4672	11.2896	16.9344	22.5792
48	6.1440	9.2160	12.2880	18.4320	24.5760
64	8.1920	12.2880	-	-	-
88.2	11.2896	16.9344	-	-	-
96	12.2880	18.4320	-	-	-

Table 1. Common Clock Frequencies

4.2 Serial Clock

The serial clock controls the shifting of data into the input data buffers. The CS4334 family supports both external and internal serial clock generation modes. Refer to Figures 10-13 for data formats.

4.2.1 External Serial Clock Mode

The CS4334 family will enter the External Serial Clock Mode when 16 low to high transitions are detected on the DEM/SCLK pin during any phase of the LRCK period. When this mode is enabled, the Internal Serial Clock Mode and de-emphasis filter cannot be accessed. The CS4334 family will switch to Internal Serial Clock Mode if no low to high transitions are detected on the DEM/SCLK pin for 2 consecutive frames of LRCK. Refer to Figure 14.

4.2.2 Internal Serial Clock Mode

In the Internal Serial Clock Mode, the serial clock is internally derived and synchronous with MCLK and LRCK. The SCLK/LRCK frequency ratio is either 32, 48, or 64 depending upon data format. Operation in this mode is identical to operation with an external serial clock synchronized with LRCK. This mode allows access to the digital de-emphasis function. Refer to Figures 10 - 14 for details.

4.3 De-Emphasis

The CS4334 family includes on-chip digital de-emphasis. Figure 9 shows the de-emphasis curve for Fs equal to 44.1 kHz. The frequency response of the de-emphasis curve will scale proportionally with changes in sample rate, Fs.

The de-emphasis filter is active (inactive) if the DEM/SCLK pin is low (high) for 5 consecutive falling edges of LRCK. This function is available only in the internal serial clock mode.

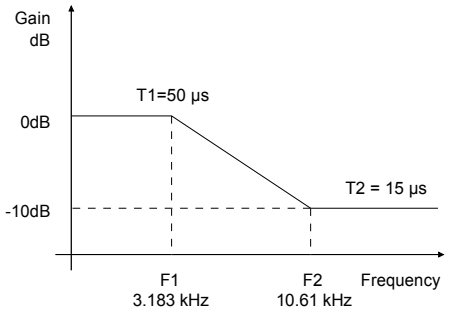

Figure 9. De-Emphasis Curve (Fs = 44.1kHz)

4.4 Initialization and Power-Down

The Initialization and Power-Down sequence flow chart is shown in Figure 14. The CS4334 family enters the Power-Down State upon initial power-up. The interpolation filters and delta-sigma modulators are reset, and the internal voltage reference, one-bit digital-to-analog converters and switched-capacitor low-pass filters are powered down. The device will remain in the Power-Down mode until MCLK and LRCK are present. Once MCLK and LRCK are detected, MCLK occurrences are counted over one LRCK period to determine the MCLK/LRCK frequency ratio. Power is then applied to the internal voltage reference. Finally, power is applied to the D/A converters and switched-capacitor filters, and the analog outputs will ramp to the quiescent voltage, V_Q.

4.5 Output Transient Control

The CS4334 family uses Popguard® technology to minimize the effects of output transients during power-up and power-down. This technique eliminates the audio transients commonly produced by single-ended single-supply converters when it is implemented with external DC-blocking capacitors connected in series with the audio outputs. To make best use of this feature, it is necessary to understand its operation.

When the device is initially powered-up, the audio outputs, AOUTL and AOUTR, are clamped to AGND. After a short delay of approximately 1000 sample periods, each output begins to ramp towards its quiescent voltage, V_Q. Approximately 10,000 sample cycles later, the outputs reach V_Q and audio output begins. This gradual voltage ramping allows time for the external DC-blocking capacitor to charge to V_Q, effectively blocking the quiescent DC voltage.

To prevent transients at power-down, the device must first enter its power-down state. This is accomplished by removing MCLK or LRCK. When this occurs, audio output ceases and the internal output buffers are disconnected from AOUTL and AOUTR. A soft-start current sink is substituted in place of AOUTL and AOUTR which allows the DC-blocking capacitors to slowly discharge. Once this charge is dissipated, the power to the device may be turned off, and the system is ready for the next power-on.

To prevent an audio transient at the next power-on, the DC-blocking capacitors must fully discharge before turning off the power or exiting the power-down state. If full discharge does not occur, a transient will occur when the audio outputs are initially clamped to AGND. The time that the device must remain in the power-

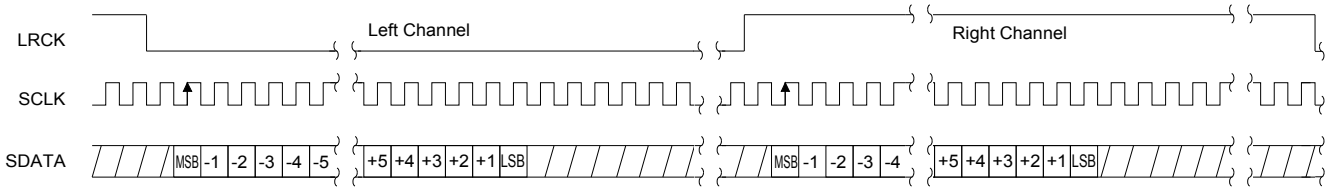
down state is related to the value of the DC-blocking capacitance. For example, with a 3.3 μF capacitor, the time that the device must remain in the power-down state will be approximately 0.4 seconds.

4.6 Grounding and Power Supply Decoupling

As with any high resolution converter, the CS4334 family requires careful attention to power supply and grounding arrangements to optimize performance. Figure 1 shows the recommended power arrangement with VA connected to a clean +5V supply. For best performance, decoupling capacitors should be located as close to the device package as possible with the smallest capacitor closest.

4.7 Analog Output and Filtering

The analog filter present in the CS4334 family is a switched-capacitor filter followed by a continuous time low pass filter. Its response, combined with that of the digital interpolator, is given in Figures 15 - 22.



Internal SCLK Mode	External SCLK Mode

5. PARAMETER DEFINITIONS

Total Harmonic Distortion + Noise (THD+N)

The ratio of the rms value of the signal to the rms sum of all other spectral components over the specified bandwidth (typically 10Hz to 20kHz), including distortion components. Expressed in decibels.

Dynamic Range

The ratio of the full scale rms value of the signal to the rms sum of all other spectral components over the specified bandwidth. Dynamic range is a signal-to-noise measurement over the specified bandwidth made with a -60 dBFS signal. 60 dB is then added to the resulting measurement to refer the measurement to full scale. This technique ensures that the distortion components are below the noise level and do not effect the measurement. This measurement technique has been accepted by the Audio Engineering Society, AES17-1991, and the Electronic Industries Association of Japan, EIAJ CP-307.

Interchannel Isolation

A measure of crosstalk between the left and right channels. Measured for each channel at the converter's output with all zeros to the input under test and a full-scale signal applied to the other channel. Units in decibels.

Interchannel Gain Mismatch

The gain difference between left and right channels. Units in decibels.

Gain Error

The deviation from the nominal full-scale analog output for a full-scale digital input.

Gain Drift

The change in gain value with temperature. Units in ppm/°C.

8. ORDERING INFORMATION

Model	Temperature	Package	Container	Serial Interface
CS4334-KSZ	-10 to +70 °C	8-pin Plastic SOIC, lead free	Rail	16 to 24-bit, I²S
CS4335-KSZ	-10 to +70 °C	8-pin Plastic SOIC, lead free	Rail	16 to 24-bit, left justified
CS4338-KSZ	-10 to +70 °C	8-pin Plastic SOIC, lead free	Rail	16-bit, right justified
CS4339-KSZ	-10 to +70 °C	8-pin Plastic SOIC, lead free	Rail	18-bit, right justified, 32 F_S Internal SCLK mode
CS4334-KSZR	-10 to +70 °C	8-pin Plastic SOIC, lead free	Tape & reel	16 to 24-bit, I²S
CS4335-KSZR	-10 to +70 °C	8-pin Plastic SOIC, lead free	Tape & reel	16 to 24-bit, left justified
CS4338-KSZR	-10 to +70 °C	8-pin Plastic SOIC, lead free	Tape & reel	16-bit, right justified
CS4339-KSZR	-10 to +70 °C	8-pin Plastic SOIC, lead free	Tape & reel	18-bit, right justified, 32 F_S Internal SCLK mode
CS4334-DSZ	-40 to +85 °C	8-pin Plastic SOIC, lead free	Rail	16 to 24-bit, I²S
CS4334-DSZR	-40 to +85 °C	8-pin Plastic SOIC, lead free	Tape & reel	16 to 24-bit, I²S

9. FUNCTIONAL COMPATIBILITY

CS4330-KS ⇒ CS4339-KSZx
CS4331-KS ⇒ CS4334-KSZx
CS4333-KS ⇒ CS4338-KSZx

10.REVISION HISTORY

Revision	Changes
F5	Corrected “B” to “b” and “C” to “c” to match drawing in Package Dimensions. Updated legal text.
F6	Changed “One-half LSB...” to “One LSB of triangular PDF dither added to data” in footnote to Analog Characteristics specification table. Added tape and reel options to the Ordering Information section and updated references to -KSZ and -DSZ in specification tables to show -KSZR and -DSZR options.
F7	Removed CS4335-DSZ, CS4338-DSZ, CS4339-DSZ, CS4335-DSZR, CS4338-DSZR, and CS4339-DSZR in and Analog Characteristics specification table and Ordering Information. Removed CS4330-BS, CS4331-BS, and CS4333-BS from Functional Compatibility.

Contacting Cirrus Logic Support

For all product questions and inquiries, contact a Cirrus Logic Sales Representative.

IMPORTANT NOTICE

The products and services of Cirrus Logic International (UK) Limited; Cirrus Logic, Inc.; and other companies in the Cirrus Logic group (collectively either “Cirrus Logic” or “Cirrus”) are sold subject to Cirrus Logic’s terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, indemnification, and limitation of liability. Software is provided pursuant to applicable license terms. Cirrus Logic reserves the right to make changes to its products and specifications or to discontinue any product or service without notice. Customers should therefore obtain the latest version of relevant information from Cirrus Logic to verify that the information is current and complete. Testing and other quality control techniques are utilized to the extent Cirrus Logic deems necessary. Specific testing of all parameters of each device is not necessarily performed. In order to minimize risks associated with customer applications, the customer must use adequate design and operating safeguards to minimize inherent or procedural hazards. Cirrus Logic is not liable for applications assistance or customer product design. The customer is solely responsible for its selection and use of Cirrus Logic products. Use of Cirrus Logic products may entail a choice between many different modes of operation, some or all of which may require action by the user, and some or all of which may be optional. Nothing in these materials should be interpreted as instructions or suggestions to choose one mode over another. Likewise, description of a single mode should not be interpreted as a suggestion that other modes should not be used or that they would not be suitable for operation. Features and operations described herein are for illustrative purposes only.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE (“CRITICAL APPLICATIONS”). CIRRUS LOGIC PRODUCTS ARE NOT DESIGNED, AUTHORIZED OR WARRANTED FOR USE IN PRODUCTS SURGICALLY IMPLANTED INTO THE BODY, AUTOMOTIVE SAFETY OR SECURITY DEVICES, NUCLEAR SYSTEMS, LIFE SUPPORT PRODUCTS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF CIRRUS LOGIC PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER’S RISK AND CIRRUS LOGIC DISCLAIMS AND MAKES NO WARRANTY, EXPRESS, STATUTORY OR IMPLIED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSE, WITH REGARD TO ANY CIRRUS LOGIC PRODUCT THAT IS USED IN SUCH A MANNER. IF THE CUSTOMER OR CUSTOMER’S CUSTOMER USES OR PERMITS THE USE OF CIRRUS LOGIC PRODUCTS IN CRITICAL APPLICATIONS, CUSTOMER AGREES, BY SUCH USE, TO FULLY INDEMNIFY CIRRUS LOGIC, ITS OFFICERS, DIRECTORS, EMPLOYEES, DISTRIBUTORS AND OTHER AGENTS FROM ANY AND ALL LIABILITY, INCLUDING ATTORNEYS’ FEES AND COSTS, THAT MAY RESULT FROM OR ARISE IN CONNECTION WITH THESE USES.

This document is the property of Cirrus Logic and by furnishing this information, Cirrus Logic grants no license, express or implied, under any patents, mask work rights, copyrights, trademarks, trade secrets or other intellectual property rights. Any provision or publication of any third party’s products or services does not constitute Cirrus Logic’s approval, license, warranty or endorsement thereof. Cirrus Logic gives consent for copies to be made of the information contained herein only for use within your organization with respect to Cirrus Logic integrated circuits or other products of Cirrus Logic, and only if the reproduction is without alteration and is accompanied by all associated copyright, proprietary and other notices and conditions (including this notice). This consent does not extend to other copying such as copying for general distribution, advertising or promotional purposes, or for creating any work for resale. This document and its information is provided “AS IS” without warranty of any kind (express or implied). All statutory warranties and conditions are excluded to the fullest extent possible. No responsibility is assumed by Cirrus Logic for the use of information herein, including use of this information as the basis for manufacture or sale of any items, or for infringement of patents or other rights of third parties. Cirrus Logic, Cirrus, the Cirrus Logic logo design, and SoundClear are among the trademarks of Cirrus Logic. Other brand and product names may be trademarks or service marks of their respective owners.
