

# High Speed Dual-Channel, Bi-Directional Ceramic Digital Isolator

## NCID9211

### Description

The NCID9211 is a galvanically isolated full duplex, bi-directional, high-speed dual-channel digital isolator with output enable. This device supports isolated communications thereby allowing digital signals to communicate between systems without conducting ground loops or hazardous voltages.

It utilizes **onsemi's** patented galvanic off-chip capacitor isolation technology and optimized IC design to achieve high insulation and high noise immunity, characterized by high common mode rejection and power supply rejection specifications. The thick ceramic substrate yields capacitors with ~25 times the thickness of thin film on-chip capacitors and coreless transformers. The result is a combination of the electrical performance benefits that digital isolators offer with the safety reliability of a >0.5 mm insulator barrier similar to what has historically been offered by optocouplers.

The device is housed in a 16-pin wide body small outline package.

### Features

- Off-Chip Capacitive Isolation to Achieve Reliable High Voltage Insulation
  - ◆ DTI (Distance Through Insulation):  $\geq 0.5$  mm
  - ◆ Maximum Working Insulation Voltage:  $2000 V_{peak}$
- Full Duplex, Bi-directional Communication
- 100 KV/ $\mu$ s Minimum Common Mode Rejection
- High Speed:
  - ◆ 50 Mbit/s Data Rate (NRZ)
  - ◆ 25 ns Maximum Propagation Delay
  - ◆ 10 ns Maximum Pulse Width Distortion
- 8 mm Creepage and Clearance Distance to Achieve Reliable High Voltage Insulation.
- Specifications Guaranteed Over 2.5 V to 5.5 V Supply Voltage and  $-40^{\circ}C$  to  $125^{\circ}C$  Extended Temperature Range
- Over Temperature Detection
- Output Enable Function (Primary and Secondary Side)
- NCIV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable (Pending)
- Safety and Regulatory Approvals
  - ◆ UL1577,  $5000 V_{RMS}$  for 1 Minute
  - ◆ DIN EN/IEC 60747-17 (Pending)

### Typical Applications

- Isolated PWM Control
- Industrial Fieldbus Communications
- Microprocessor System Interface (SPI, I<sup>2</sup>C, etc.)
- Programmable Logic Control
- Isolated Data Acquisition System
- Voltage Level Translator

## RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min.	Max.	Unit
$T_A$	Ambient Operating Temperature	-40	+125	°C
$V_{DD1}$ $V_{DD2}$	Supply Voltage (Notes 3, 4)	2.5	5.5	V
$V_{INH}$	High Level Input Voltage	$0.7 \times V_{DDI}$	$V_{DDI}$	V
$V_{INL}$	Low Level Input Voltage	0	$0.1 \times V_{DDI}$	V
$V_{UVLO+}$	Supply Voltage UVLO Rising Threshold	2.2		V
$V_{UVLO-}$	Supply Voltage UVLO Falling Threshold	2.0		V
$UVLO_{HYS}$	Supply Voltage UVLO Hysteresis	0.1		V
$I_{OH}$	High Level Output Current	-2	-	mA
$I_{OL}$	Low Level Output Current	-	2	mA
DR	Signaling Rate	0	50	Mbps

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

- During power up or down, ensure that both the input and output supply voltages reach the proper recommended operating voltages to avoid any momentary instability at the output state.
- For reliable operation at recommended operating conditions,  $V_{DD}$  supply pins require at least a pair of external bypass capacitors, placed within 2 mm from  $V_{DD}$  pins 1 and 16 and GND pins 2 and 15. Recommended values are 0.1  $\mu$ F and 1  $\mu$ F.

## ISOLATION CHARACTERISTICS

Apply over all recommended conditions. All typical values are measured at  $T_A = 25^\circ\text{C}$ .

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$V_{ISO}$	Input-Output Isolation Voltage	$T_A = 25^\circ\text{C}$ , Relative Humidity < 50%, $t = 1.0$ minute, $I_{I-O} \leq 10 \mu\text{A}$ , 50 Hz (Notes 5, 6, 7)	5000			$V_{RMS}$
$R_{ISO}$	Isolation Resistance	$V_{I-O} = 500$ V (Note 5)		$10^{11}$		
$C_{ISO}$	Isolation Capacitance	$V_{I-O} = 0$ V, Frequency = 1.0 MHz (Note 5)		1		pF

- Device is considered a two-terminal device: pins 1 to 8 are shorted together and pins 9 to 16 are shorted together.
- 5,000  $V_{RMS}$  for 1-minute duration is equivalent to 6,000  $V_{RMS}$  for 1-second duration.
- The input-output isolation voltage is a dielectric voltage rating per UL1577. It should not be regarded as an input-output continuous voltage rating. For the continuous working voltage rating, refer to equipment-level safety specification or DIN EN/IEC 60747-17 Safety and Insulation Ratings Table on page 3.

11. Propagation delay  $t_{PHL}$  is measured from the 50% level of the falling edge of the input pulse to the 50% level of the falling edge of the  $V_O$  signal.
12. Propagation delay  $t_{PLH}$  is measured from the 50% level of the rising edge of the input pulse to the 50% level of the rising edge of the  $V_O$  signal.
13. PWD is defined as  $|t_{PHL} - t_{PLH}|$  for any given device.
14. Part-to-part propagation delay skew is the difference between the measured propagation delay times of a specified channel of any two parts at identical operating conditions and equal load.
15. Enable delay  $t_{PZL}$  is measured from the 50% level of the rising edge of the EN pulse to the 50% of the falling edge of the  $V_O$  signal as it switches from high impedance state to low state.
16. Disable delay  $t_{PLZ}$  is measured from the 50% level of the falling edge of the EN pulse to 0.5 V level of the rising edge of the  $V_O$  signal as it switches from low state to high impedance state.
17. Enable delay  $t_{PZH}$  is measured from the 50% level of the rising edge of the EN pulse to the 50% of the rising edge of the  $V_O$  signal as it switches from high impedance state to high state.
18. Disable delay  $t_{PHZ}$  is measured from the 50% level of the falling edge of the EN pulse to  $V_{OH} - 0.5\text{ V}$  level of the falling edge of the  $V_O$  signal as it switches from high state to high impedance state.

APPLICATIONS INFORMATION

Theory of Operation

NCID9211 is a dual-channel digital isolator that enables bi-directional communication between two isolated circuits. It uses off-chip ceramic capacitors that serve both as the isolation barrier and as the medium of transmission for signal switching using on-off keying (OOK) technique, illustrated in the single channel operational block diagram in Figure 13.

At the transmitter side, the  $V_{IN}$  input logic state is modulated with a high frequency carrier signal. The resulting signal is amplified and transmitted to the isolation barrier. The receiver side detects the barrier signal and demodulates it using an envelope detection technique. The output signal determines the  $V_O$  output logic state when the output enable control EN is at high. When EN is at low, output  $V_O$  is at high impedance state.  $V_O$  is at default state low when the power supply at the transmitter side is turned off or the input  $V_{IN}$  is disconnected.

Layout Recommendation

Layout of the digital circuits relies on good suppression of unwanted noise and electromagnetic interference. It is recommended to use 4-layer FR4 PCB, with ground plane

below the components, power plane below the ground plane, signal lines and power fill on top, and signal lines and ground fill at the bottom. The alternating polarities of the layers creates interplane capacitances that aids the bypass capacitors required for reliable operation at digital switching rates.

In the layout with digital isolators, it is required that the isolated circuits have separate ground and power planes. The section below the device should be clear with no power, ground or signal traces. Maintain a gap equal to or greater than the specified minimum creepage clearance of the device package.

Figure 16. 4-Layer PCB for Digital Isolator

For NCID9211, it is highly advised to connect at least a pair of low ESR supply bypass capacitors, placed within 2mm from the power supply pins 1 and 16 and ground pins 2 and 15. Recommended values are 1  $\mu$ F and 0.1  $\mu$ F, respectively. Place them between the  $V_{DD}$  pins of the device and the via to the power planes, with the higher frequency, lower value capacitor closer to the device pins. Directly connect the device ground pins 1, 8, 9 and 15 by via to their corresponding ground planes.

Over Temperature Detection

NCID9211 has a built-in Over Temperature Detection (OTD) feature that protects the IC from thermal damage. The output pins will automatically switch to default state when the ambient temperature exceeds the maximum junction temperature at threshold of approximately 160°C. The device will return to normal operation when the temperature decreases approximately 20°C below the OTD threshold.
